Agenda

Why Python

How Python Works

How to Run Python

Python Variable

Python Operators

What is Python?

Python is a high-level Programming Language.

Python is like talking to your computer in simple, friendly language rather than shouting instructions in complicated codes.

Python Creator

GUIDO VAN ROSSUM

When Python?

- Web Development
- Software Development
- Game Development
- Machine Learning & AI
- Data Science

Why Python?

Most Popular - Python is like a Swiss Army knife—it has tools for every situation!

Easy to Understand - Think of Python as a conversation with your computer, while Java or C is more like legal paperwork.

Why Python?

Java

```
1 class Main {  
2     public static void main(String[] args) {  
3         System.out.println("Hello, World!");  
4     }  
5 }
```

C

```
1 #include <stdio.h>  
2 int main() {  
3     printf("Hello, World!");  
4     return 0;  
5 }
```

C#

```
1 public class Program  
2 {  
3     public static void Main(string[] args)  
4     {  
5         System.Console.WriteLine("Hello, World!");  
6     }  
7 }
```

Python

```
1 print("Hello World!")
```

Python Versions

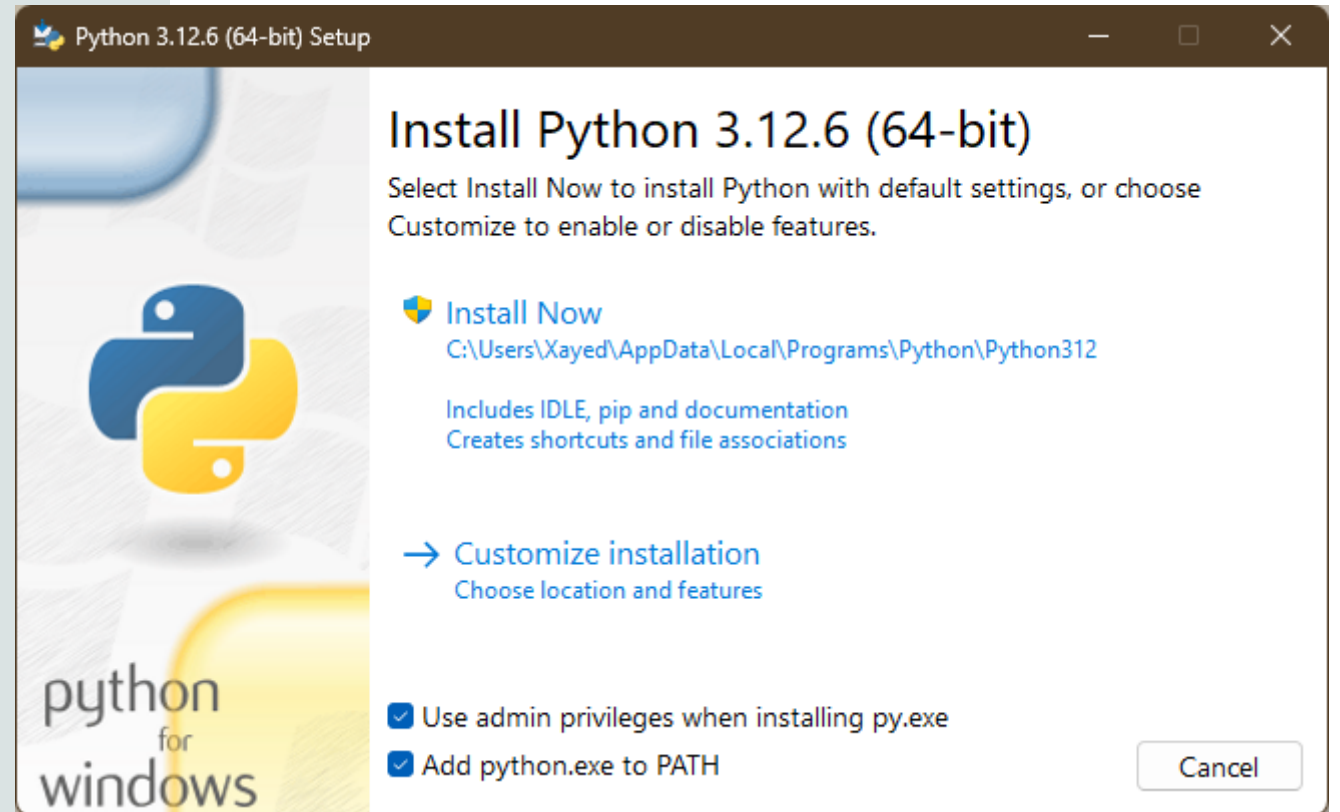

- Python 2
- Python 3

Python Software Foundation manages these Versions.

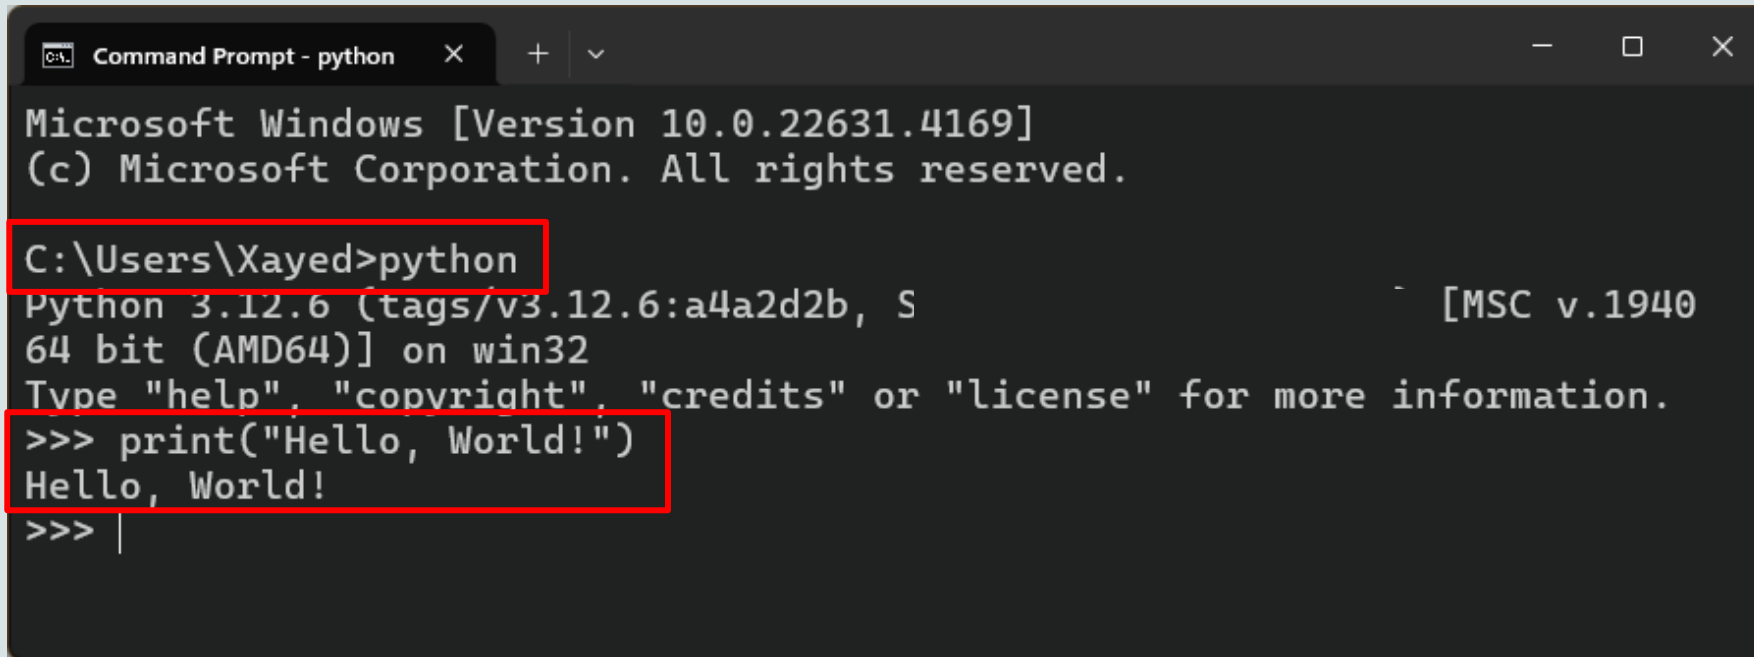

Installing Python

WHAT TO FOCUS ON

Running Python from Terminal

Python's interactive mode lets you write code line by line in the terminal.

```
Command Prompt - python
Microsoft Windows [Version 10.0.22631.4169]
(c) Microsoft Corporation. All rights reserved.

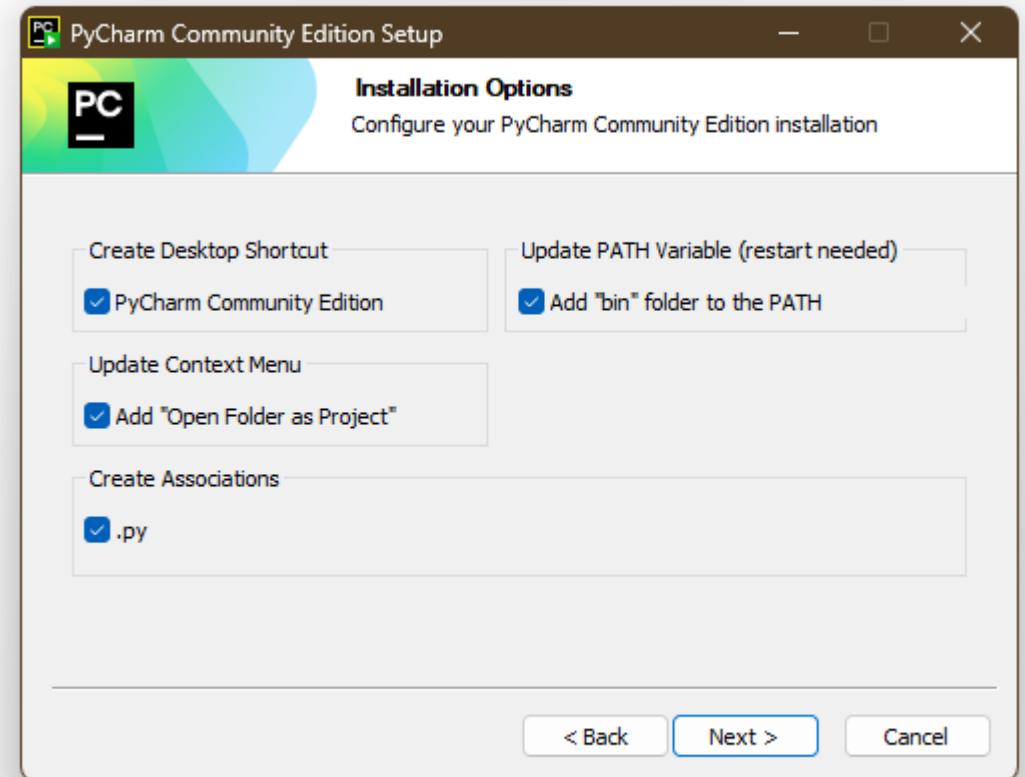

C:\Users\Xayed>python
Python 3.12.6 (tags/v3.12.6:a4a2d2b, S [MSC v.1940
64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> print("Hello, World!")
Hello, World!
>>> |
```

Installing PyCharm for Python

WHAT TO FOCUS ON

Run Your First Python Code

NOW, HOW CAN WE RUN OUR CODE?

Python Variable

The variable is simply a magic box that can contain only one item at a time.

It is like a labeled box where you keep something, and you can change what's inside later.

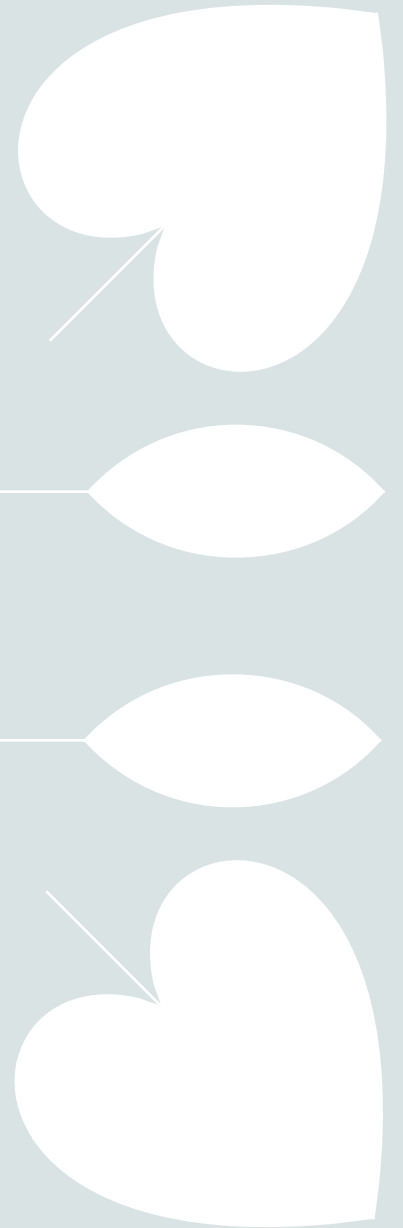

Python Variable

```
main.py  
  
x = 10
```

10
x

Python Variable

main.py

```
x = 10
```

```
y = 20
```

10

x

20

y

Python Variable

main.py

```
x = 10
```

```
y = 20
```

```
y = 30
```

10

x

30

y

Variable Naming Rules for Python

- Can only contain alpha-numeric characters and underscores.
- Must start with a letter or the underscore character.
- Must not be a reserved keyword.
- Variable names are case-sensitive.

Python Basic Data Types

- Text Types: **str**
- Numeric Types: **int**, **float**, complex
- Sequence Types: list, tuple, range
- Mapping Type: dict
- Boolean Type: **bool**

Taking Input in Python

ITS TIME TO TAKE INPUT & MAKE THE APP
PERFECT

Type Conversion / Casting in Python

Type Conversion is converting one data type to another.

Two types of type conversion:

- Explicit Conversion (Manual Conversion)
- Implicit Conversion (Automatic Conversion)

Type Conversion / Casting in Python

Explicit

```
1 a = 15
2 print(type(a))
3
4 b = int(a)
5 print(type(b))
```

Implicit

```
1 a = 15
2 print(type(a))
3
4 b = a + 3.14
5 print(type(b))
```

Python is Dynamically Typed Language

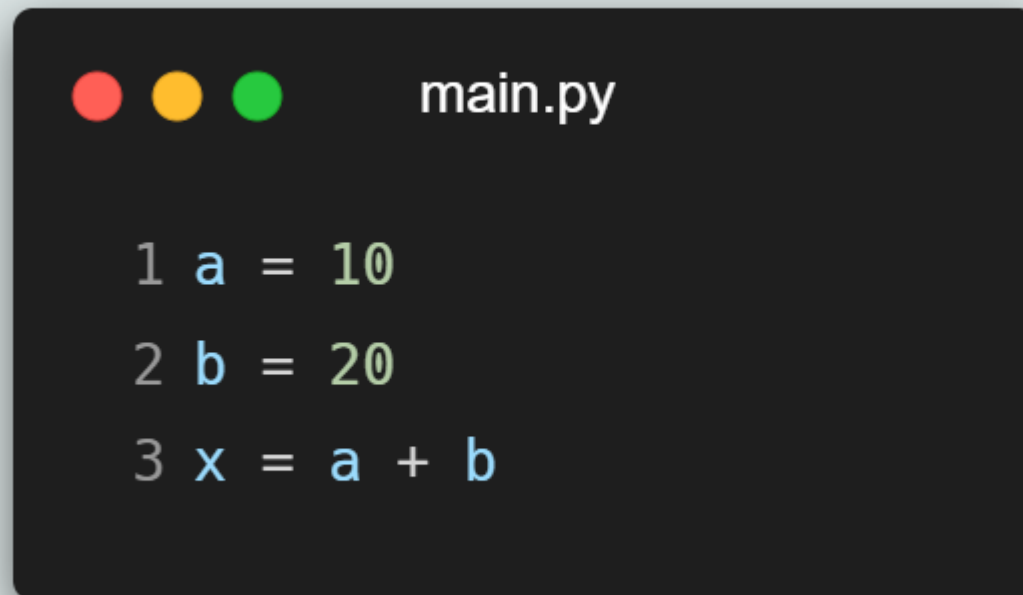

Python assigns types automatically on variables based on the value.

It even replaces the old type.

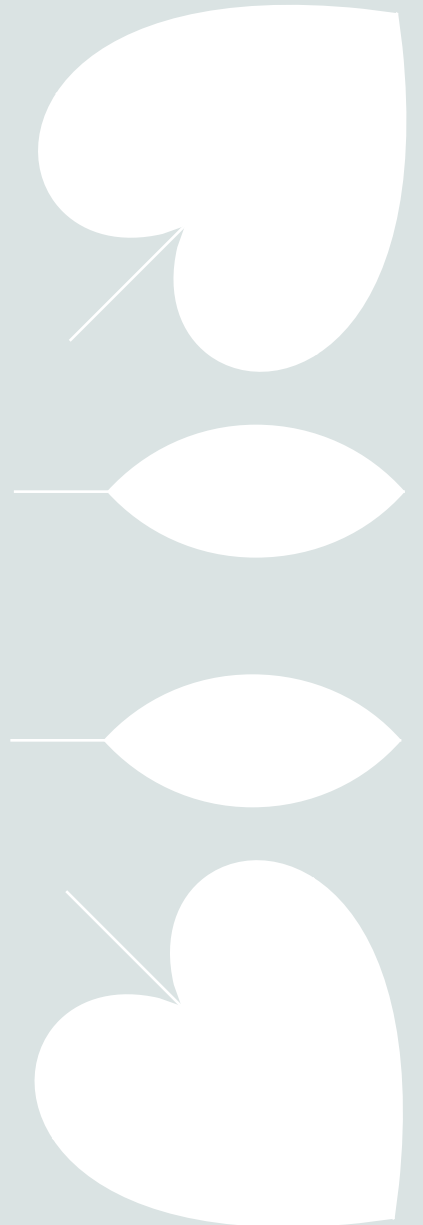

```
main.py  
  
1 a = 15  
2 print(type(a))  
3  
4 a = "hello"  
5 print(type(a))
```

Python Statement

A statement is a line / multiple lines of code giving a single instruction to your computer.

```
1 a = 10
2 b = 20
3 x = a + b
```

Python Comment

Two types:

- Single Line Comment
- Multi-Line Comment

Comments are only used to describe a block of code.

```
1 # Single Line Comment
2
3 """
4 This is a
5 Multi-Line
6 Comment
7 """
```

String in Python

0	1	2	3	4
H	E	L	L	O
-5	-4	-3	-2	-1

A string is a collection of characters.

Can be accessed & sliced by index.

```
main.py

1 a = "hello world"
2
3 print(a[1]) # e
4
5 print(a[1:4]) # ell
6
7 print(a[6:-1]) # worl
```

Python Operators

LET'S KNOW SOME MORE OPERATORS THAN WE'VE
ALREADY USED IN PREVIOUS CODES

Arithmetic Operators in Python

Operator	Name
+	Addition
-	Subtraction
*	Multiplication
/	Division
%	Modulus
**	Exponentiation
//	Floor Division

Some Practice Problems in Python

- Make a program that receives two numbers as input and shows the sum of those two numbers.
- Make a program to take two numbers and swap them.
